The Best Static Analysis and SAST Tool for Accelerating Time-to-Market and Delivering High Quality, Secure, and Compliant Code

Overview

Klocwork is a static analysis and SAST tool for C, C++, C#, Java, JavaScript, Python, and Kotlin. It identifies software security, quality, and reliability issues to help enforce standards compliance.

Built for enterprise DevOps and DevSecOps, Klocwork scales to projects of any size, integrates with large complex environments, a wide range of developer tools, and provides control, collaboration, and reporting.

Klocwork’s Differential Analysis engine provides instant analysis results, while maintaining accuracy, and integrates seamlessly with CI/CD pipelines to automate Continuous Compliance — safeguarding your software from vulnerabilities with every commit.

Key Features

FIND SECURITY VULNERABILITIES WITH SAST

Our security-focused static analysis engine identifies security vulnerabilities as they are introduced – helping to find and fix vulnerabilities early, and provide compliance to internationally and industry recognized security standards, as well as your own organizational requirements.

PROJECT STREAMS

Project Streams provides easy management of shared code bases that have multiple variants or branches by simplifying project rule configuration, issue management, defect citing, reporting, and efficient data storage of analysis data.

Creating streams provides the following benefits:

- Assign a single project rule configuration to all variants.
- Issues common to multiple variants are automatically kept in sync and only require citing once.
- Easily identify identical issues across multiple streams and issues unique to a specific stream.
- Generate reports on individual streams for compliance, functional safety, or other evidential purposes.
- More convenient organization and efficient storage of analysis data.
DEVOPS READY

Klocwork tools are designed with Continuous Integration and Continuous Delivery foremost in our thinking, which makes it easy to include static code analysis as part of your CI/CD pipelines. Differential Analysis: Using system context data from the Klocwork Server, it is possible to analyze only the files that changed, providing differential analysis results as if the entire system had been analyzed and the shortest possible analysis times.

Easy to Automate: Klocwork tools have common command line interfaces, and all defect data is accessible via a REST API using standard output formats, such as XML, JSON, and PDF.

Containerized Builds: Klocwork can be run within containerized and Cloud build systems and supports the provisioning of machine instances as required. Providing maximum flexibility and opportunity to use on-premise or external Cloud services for code analysis.

CONTROL, COLLABORATION, AND REPORTING

The Klocwork Validate platform is a centralized store of analysis data, trends, metrics, and configurations for codebases across the organization — accessed through a web browser.

The dashboard is highly customizable, enabling your developers, managers, and other stakeholders to:

• Define global or project-specific QA and security objectives and rule configurations.
• Control access permissions and approval workflows.
• View trending and metrics data for project quality and compliance.
• Produce compliance and security reports.
• Prioritize defects based on severity, location, and lifecycle.
• Use Smart Rank to assist developers in prioritizing fixes based on defect likelihood, which when combined with issue severity, provides an overall vulnerability risk score.
• Distinguish new issues from legacy code issues.
• Push backlog issues to Change Control systems.

DESIGNED FOR DEVELOPERS

By seamlessly integrating static code analysis with the rest of your development toolset, Klocwork will shift-left defect detection and improve developer adoption as a tool for developer training and increasing productivity.

No User Configuration: Klocwork provides out of the box support for hundreds of compilers and cross-compilers.

Easy to Use: Plugins for popular IDEs (including Microsoft Visual Studio, Eclipse, IntelliJ, and more).

Connected Desktop: Local code changes made using the Klocwork plugins provide immediate differential analysis results within IDEs.

Detailed Feedback and Help: Defects and coding violations are identified by severity, location and risk. Each defect report is further enhanced with detailed traceback information and rich, context-sensitive help and guidance on remediation. Facilitating understanding and learning.

In addition, Klocwork features a Secure Code Warrior integration, which provides you with software security lessons and training tools for many common development languages as you write code.

Custom Rules: A graphical custom checker creation tool makes the implementation of project- or organization-specific rules quick and easy — further enriching the learning opportunities.

Architectural Analysis: Klocwork integrates with architectural visualization and enforcement tools like Structure 101 to allow users to further improve the overall quality and maintainability of their codebase through clean and correct dependencies.
