

PRODUCT BRIEF

Git Code Hosting and Collaboration for Scalable DevOps

Helix TeamHub is the only code hosting and collaboration solution that supports multi-repo operations and high-performance CI/CD with Git.

In addition to supporting numerous source code repos (i.e., Git, SVN, and Mercurial), TeamHub lets you manage Maven and Ivy artifact repositories and Docker container registries - all under one intuitive, web-based platform.

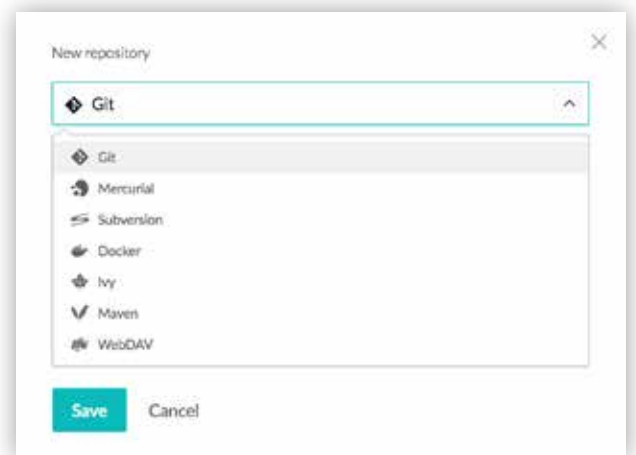

Helix TeamHub also provides several tools to help you manage your projects with ease, such as a Kanban board for Agile issue tracking and a Git-powered Wiki for storing all your project-specific documents.

MULTI-REPO OPERATIONS

Helix TeamHub provides teams with a centralized view of their projects and repositories for streamlined development and collaboration. Managing your repos and build artifacts centrally makes access control quick and painless. With self-service management, team leads can easily restrict access to certain parts of the code base to specific personnel. Seamlessly manage dependencies across your code base with multi-repo code reviews. You can group commits and gate merges by requiring passing builds or approvals for each of the commits.

HIGH PERFORMANCE CI/CD WITH GIT

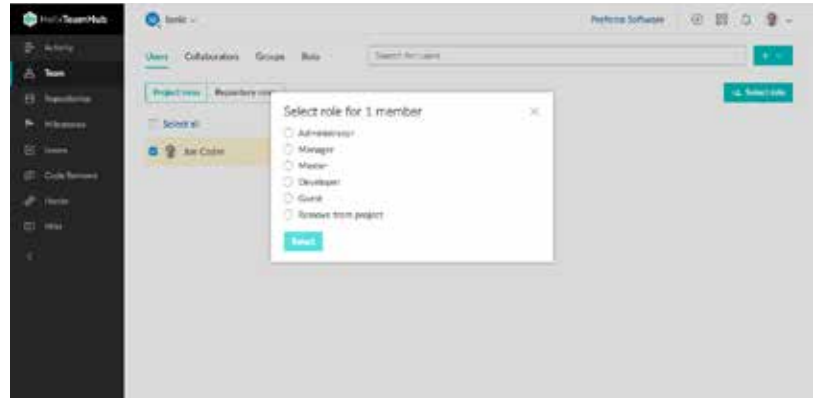

With Helix TeamHub Enterprise, you can store Git repos natively in Helix Core to enable high-performance builds for CI/CD. This on-premises option helps teams achieve up to 80 percent faster builds than a Git server and seamlessly handles concurrent Git commits from large, geographically dispersed teams.

Manage multiple repository types in Helix TeamHub

SCALABLE DEVOPS

Helix TeamHub Enterprise helps DevOps teams ship code on-demand thanks to faster initial checkouts and updates. By leveraging Perforce server technology, TeamHub Enterprise significantly reduces workflow latency across the development pipeline by allowing remote teams to access and manage files at LAN speed. In addition to facilitating CI, Helix TeamHub automates the build and deployment process by seamlessly integrating with more than 75 of the most popular tools with out-of-the-box hooks.

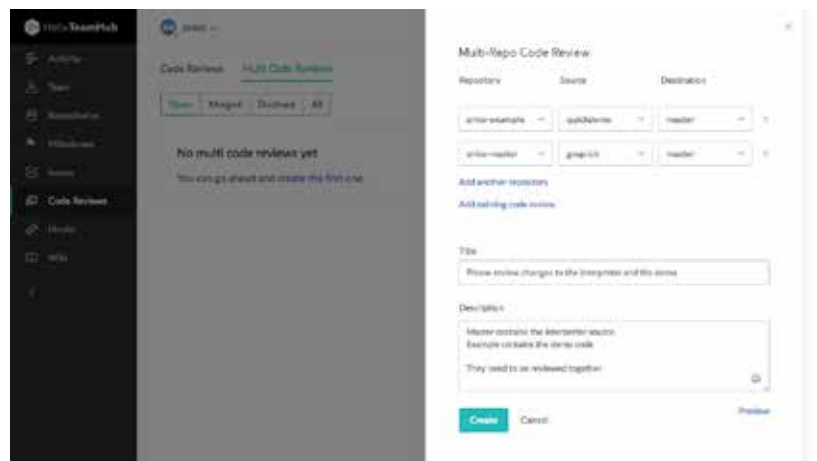

Customizing member permissions in Helix TeamHub

SIMPLE CODE REVIEW & COLLABORATION

With simple, branch-based code review workflows, Helix TeamHub makes it easy to ensure every change goes through a review and acceptance process - you can even incorporate automated builds and testing. Teams collaborate easily on single or multi-repo projects with:

- Code search across Git repos by projects, file names, commit messages, and more.
- Ensure changes to code across multiple repositories are reviewed together in a single code review prior to merging.
- Expandable diffs for added context and less time in the command line.
- Built-in Wiki for project-specific documentation and file-sharing.
- Kanban-style issue tracking for Agile workflows.
- Task comments inside code reviews ensure your comments are addressed before the code is merged.
- Threaded conversations during code reviews help you determine message context quickly and efficiently.

Group commits, perform code reviews across repos, and gate merges with multi-repo code review.
