

# P4 Plan vs. Jira

Discover Which Tool is Best for Your Organization

Both Jira and P4 Plan are used by organizations to help plan, manage, and track development projects. Not sure which is the best for you? Find out below.

## Using P4 Plan

If your organization is using P4, P4 Plan is the best planning tool for you as it's better integrated and supported by the same vendor (Perforce).

## Deploying On-Premise

P4 Plan is the best option for organizations who require the heightened security and flexibility with on-premise installations, as Atlassian is making its bet on cloud only in the future.

## Looking for a Specialized Planning and Tracking Tool

P4 Plan is specialized for real-time workflows (including game dev and hardware design). Admins can utilize advanced GraphQL API, SDK, and Webhook capabilities to automate their pipeline, or connect P4 Plan to Claude or VS Code Copilot with our free and open-source MCP server.

## Looking for a General Project Management Tool

If you are looking for a more general project management tool, Jira is a great place to start. With a large ecosystem of plugins available on its marketplace, Jira can accommodate a wide range of use cases.

## Looking for an Issue Tracking Tool

If you simply require an issue tracker, Jira is the best choice for you as this is what the product is built for at its core.
